

(5) detecting interleaving: the stream is two independent walks;
only a learner that has DE-INTERLEAVED them can use R_3

lag-2 hypothesis:
predict a RING-neighbour of R_3
(the true generator)

lag-1 hypothesis:
predict from G_3 's neighbours
(junk: different walk)

the measurement: LLM sits between merged
and hierarchical (mixture $\lambda = 0.64$)
