

Three-mechanism separation: capture is **ROLE-STRUCTURAL**, not lexical; self-attribution **RESTRAINS** i

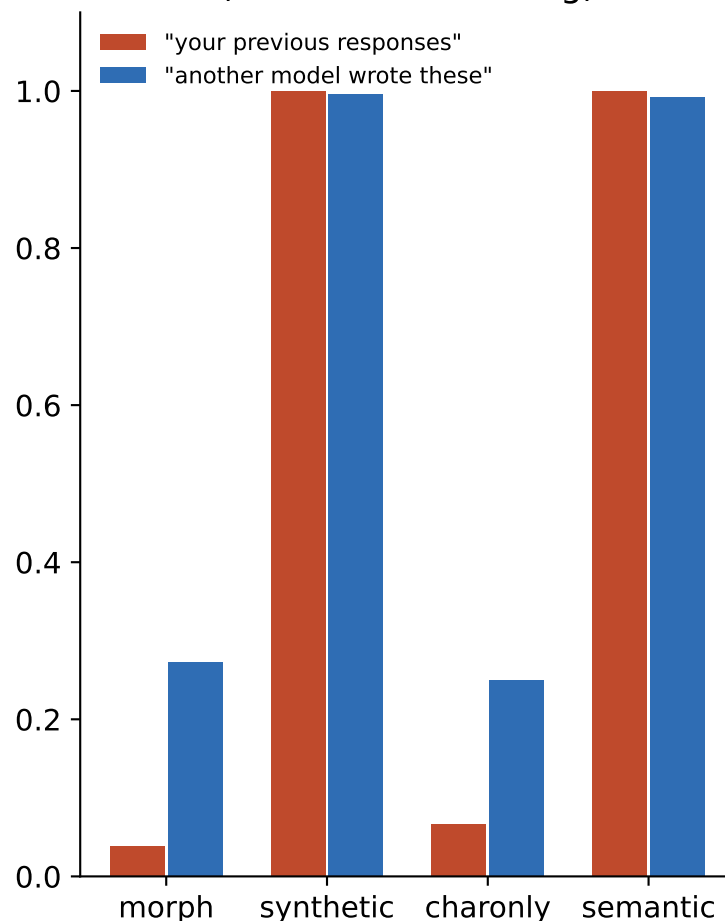

pooled contrasts (MC): $\Delta_{\text{lexical}} = 0.000$ · $\Delta_{\text{structural}} = +0.577$ · $\Delta_{\text{attribution}} = -0.102$ (negative = self < other) · interaction = -0.102

synthetic/semantic series continue at ceiling (≈ 1.0) regardless of ownership; morph/char-overlap leave room and show the self-suppression (0.04 vs 0.27; 0.07 vs 0.25).

Placement: only the ANSWER SLOT matters
(lexical priming = 0.00 exactly)

Attribution: SELF suppresses continuation
(where not at ceiling)

Attribution info enters by ~L48
(suffix patch reaches the 'other' level)
