

Steering each grid cut: control vs dose. All coordinate cuts saturate to full control ( $\approx 1 - \text{baseline}$ ) — steerability is uniform across cuts & models (the 2-D coordinate plane is fully linear).

Low-dose steering rate per cut. If Gemma carved diagonally you'd expect Gemma's diag/anti-diag > x/y;  
in practice all cuts move together — steering can't see the frame rotation (all span one plane).
